Could '1 megawatt racks' transform data center power architecture?

The OCP community is exploring radical redesigns of data center power architecture, including the concept of '1 Megawatt racks' that would move power supplies out of server racks into separate rack units. Eventually, power generation capabilities could move entirely outside the computing floor to become integrated with the data center facility.

How much power does a datacenter rack use?

While the power consumption of a typical datacenter rack might fall somewhere between 5 kW to about 30 kW, the explosion in the use of servers stuffed with power-hungry GPU accelerators has seen this figure rise to 100 kW or more, with Nvidia's DGX GB200 NVL72 system pushing 120 kW.

What needs to change to enable 1 mw racks?

Cooling systems aren't the only thing that needs to change to enable 1 MW racks. Power supply systems are another critical component. Flex is currently working on 400 volt (V) direct current (DC) systems, and Butler said it's already eyeing 800V DC and even 1500V DC for the future.

Could '1 megawatt racks' reduce energy losses?

The Open Compute Project Foundation (OCP) is spearheading a radical redesign of data center power architecture to support AI's explosive growth, including the concept of '1 Megawatt racks' that could reduce energy losses from 40% to just 7%.
