In this guide, we will explore the best AI-powered energy companies with their technologies and innovative approaches. In the renewable energy sector, AI has led to significant ...

Last year, the U.S. saw additions of about 45 GW of solar and wind combined. This increase from 2023 shows robust progress, but we still need more growth in carbon free generation ...

The U.S. Department of Energy (DOE) has launched an initiative to speed up the development of large-scale power transmission and generation projects as AI exerts immense ...

Now, as new tools change the race for technological dominance, America must invest in affordable, reliable, homegrown energy sources -- like solar and energy storage -- to power our ...

In 2025, PV electricity generation is projected to supply 9.0% of total U.S. electricity generation. Storage of intermittent PV and wind electricity generation is essential to reduce fossil fuel electricity generation.

Solar continues to be the main fuel type for new additions, with over 30,000 MW of solar energy added in 2024, nearly double the amount added in 2023. This report also analyzes prospective generation ...

Under recent projections, the majority of the United States' utility-scale power capacity additions are expected to be from renewable sources, with solar being the largest contributor.

According to the DOE, the massive deployment of wind and solar energy expected over the next five years will not be enough to support the growing power demand brought on by AI data ...
