---

As tariffs on Chinese graphite escalate, the ripple effects are reshaping the electric vehicle (EV) battery industry and unlocking new investment opportunities in energy storage.

In 2024, global graphite demand reached around 3.7-3.8 million metric tonnes, with most of the demand split across two major industries--graphite for high-purity electrodes used in steel production, and ...

Here, we use industry-vetted data on key input parameters, including cost of raw materials, energy, labor, equipment, and construction to develop detailed process-based cost models for natural and ...

A growing vulnerability is occurring in one of America's most pressing critical minerals: graphite, the unsung workhorse of rechargeable batteries for electric vehicles, consumer electronics, ...

As the world shifts toward more sustainable transportation and renewable energy technologies, the demand for graphite, a key component in lithium-ion battery (LIB) anodes for EVs ...

preliminary anti-dumping (AD) tariffs of 93.5% on imports of active anode-grade graphite from China. This material is foundational to lithium-ion batter.

In this article, we consider trade of three key minerals needed for batteries--graphite, lithium, and cobalt--among China and key global regions.

New research from the University of Michigan and Ford Motor Co. shows that the United States could mine enough graphite to build batteries for electric vehicles and other applications, but ...
