Compared with non-concentrating GaAs solar cells, the structure of concentrating GaAs solar cells has an extra layer under the base layer to reflect secondary carriers back to improve cell efficiency.

A new kind of concentrator suitable for operation at 1000 suns has been developed. The technological challenges related with this high concentration level have been undertaken and solved.

The III-V compound solar cells represented by GaAs solar cells have contributed as space and concentrator solar cells and are important as sub-cells for multi-junction solar cells.

Solar panels made of gallium arsenide contain a layer of gallium and arsenic that can produce a lot of energy. Because it is rarer than gold, it can be extremely expensive.

GaInP₂/GaAs/Ge 3J cell layers were grown at Spectrolab in a production MOVPE reactor incorporating high-efficiency cell structures suitable for the high current densities encountered at concentration and ...

Here, we demonstrate that thin-film GaAs solar cells produced by ...

These three-junction single-crystal devices are grown by metal-organic vapor phase epitaxy on GaAs substrates. The device is grown in an inverted configuration because the bottom junction is lattice ...

Here, we demonstrate that thin-film GaAs solar cells produced by an accelerated non-destructive ELO (ND-ELO) fabrication process that are integrated with simple thermoformed...
