Assistant Professor Gabriela Schlau-Cohen has observed, for the first time, a mechanism that plants use to protect themselves from sun damage. For plants, sunlight can be a double-edged ...

Agrivoltaics is the combination of agricultural production (which converts sunlight to food) with solar photovoltaic technology (which converts sunlight directly into electricity). The practice...

Solar energy technologies and power plants do not produce air pollution or greenhouse gases when operating. Using solar energy can have a positive, indirect effect on the environment when solar ...

By harnessing solar energy, solar-powered greenhouses create sustainable growing conditions for plants, regardless of external climate variations. This guide explores how solar ...

Trees, shrubs, and groundcover plants can also shade the ground and pavement around the home. This reduces heat radiation and cools the air before it reaches your home's walls and windows.

Given the findings, the research seems promising enough to support APV practices that limit PV panel shading to be lower than 25% to avoid affecting crop growth, assumed to be the ...

In this work, we evaluate the effects of wavelength-selective cutoffs of visible and near-infrared (biologically active) radiation using transparent photovoltaic (TPV) absorbers on the growth...

All solar arrays require vegetation management to prevent vegetation from affecting the solar system. The plant species present will impact the frequency, ease, and cost of managing this ...
