A microgrid, regarded as one of the cornerstones of the future smart grid, uses distributed generations and information technology to create a widely distributed automated energy delivery ...

This report identifies research and development (R& D) areas targeting advancement of microgrid protection and control in an increasingly complex future of microgrids.

NLR develops and evaluates microgrid controls at multiple time scales. Our researchers evaluate in-house-developed controls and partner-developed microgrid components using software ...

This white paper focuses on tools that support design, planning and operation of microgrids (or aggregations of microgrids) for multiple needs and stakeholders (e.g., utilities, developers, ...

This paper concludes that presence of an electronically-interfaced DG unit makes the concept of micro-grid a technically viable option for further investigations.

The purpose of this research is to present an overview of the development of control methods in MG and to conduct a systematic evaluation of the various strategies for MG control that ...

The first group includes conventional (rotary) units based on synchronous or induction generators that are interfaced directly to the microgrid. The second group are interfaced to the microgrid through ...

The two control approaches for microgrids namely hierarchical control and distributed control are presented in Reference 207, where, the main features of these two methods are discussed and ...
