What is shared energy storage planning?

The objective function of the shared energy storage planning model is to maximize the collective interests of the DC alliance, i.e., minimize the sum of SESS investment costs and electricity procurement costs of all data centers, which ensures that shared energy storage capacity is allocated more economically in typical scenarios:

Does energy storage play a significant role in smart grids and energy systems?

Abstract: Energy storage (ES) plays a significant role in modern smart grids and energy systems. To facilitate and improve the utilization of ES, appropriate system design and operational strategies should be adopted.

What are the configuration parameters for shared energy storage?

For the configuration parameters, the data center alliance can configure shared energy storage ranging from 0 to 2 MW × 6 h. The unit power cost and unit energy capacity cost of energy storage are 3500 yuan/kW and 350 yuan/ (kWh) 32, respectively.

What is shared energy storage operation mode?

First, the shared energy storage operation mode for the data center alliance is studied, including capacity allocation of shared energy storage across scenarios, a cost-sharing model, and a Nash bargaining-based benefit allocation method to ensure fairness among data center users.
