How do inverters work in a rooftop solar system?

The electricity produced by solar panels is initially a direct current (DC). Inverters change the raw DC power into AC power so your lamp can use it to light up the room. Inverters are incredibly important pieces of equipment in a rooftop solar system. There are three options available: string inverters, microinverters, and power optimizers.

What does a solar inverter do?

Solar inverters are an integral part of every solar power system. They perform two key functions: All solar panels generate Direct Current (DC); a solar inverter is required to convert this into Alternating Current (AC), the form of electricity usable by your home.

What are the different types of solar inverters?

To recap, there are three kinds of inverters: string inverters, microinverters, and power optimizers. They all transform the power your solar panels generate from direct current (DC) to alternating current (AC). This makes the energy usable for your home. Here are a few things to look for when shopping for inverters...
