If you're noticing fast battery drain while driving your Tesla, explore our comprehensive guide on preventing and resolving the issue of rapid battery depletion.

If your car doesn't have an LFP battery then generally stick to 80% or less for daily charging but feel free to use 100% if you are going on a trip that will challenge your range.

The myth that LFP batteries like the one in the RWD Tesla Model 3 can be charged to 100% at all times without worries has been shattered by a new study.

A battery health test on a Tesla Model 3 with only 10,000 miles on the odometer showed that LFP cells can have high degradation despite high-durability claims

The video also shares research information that LFP will degrade faster if charged to 100% and also speculates that even if charged to 100% the LFP will still likely outlive NMC batteries.

For the entry-level rear-wheel-drive Tesla Model 3 with the lithium iron phosphate (LFP) battery, one of the best ways to minimize battery degradation, according to Tesla, is to fully...

The car was built in Fremont, California, and has so far driven nearly 110,000 miles. It's powered by an LFP battery pack that sends juice to a rear-mounted electric motor.

"We are raising serious concerns about Tesla Model 3/Y LG NCM811 battery packs (LGES Nanjing), which exhibit very high failure rates and significantly shorter lifespans compared to ...
