A typical large wind turbine can generate up to 1.8 MW of electricity, or 5.2 million KWh annually, under ideal conditions -- enough to power nearly 600 households.

The energy in the wind turns the blades that are connected to the main shaft, which turns and spins a second shaft, which spins a generator to create electricity.

Learn how wind turbines work and explore the different types of wind energy, from small turbines to massive offshore wind farms. This site includes lots of cool facts about wind power and its impact on ...

How Do Wind Turbines Work? Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like ...

Wind turbines can be standalone structures, or they can be clustered together in what is known as a wind farm. While one turbine can generate enough electricity to support the energy ...

Wind turbines are converting the kinetic energy of moving air (wind) into electricity, very similar to how hydroelectric turbines are converting the kinetic energy of moving water into electricity.

Discover how wind turbines generate electricity by converting wind energy into mechanical and electrical energy with key components like rotor blades, hub, and generator.

A wind turbine works by catching the energy in the wind, using it to turn the blades, and converting the energy to electricity through a generator in the part of the turbine called a ...
