Why is my SolarEdge inverter NOT working?

If no issues are found within the connections in the strings, record all your troubleshooting steps, and contact SolarEdge Technical Support. A single string not operating out of multiple strings installed to the inverter usually indicates an issue within the string itself and not an issue with the inverter.

Does a string inverter malfunction?

While not an inverter malfunction, this performance limitation is inherent to how basic string inverters work with series-connected panels. Shade on even a small part of one panel acts like a bottleneck, reducing the electrical current flow for the entire string connected to that inverter input (MPPT).

Are string inverters a good choice?

String inverters, where panels are linked in series ('strings') feeding into the inverter, are a popular choice due to their balance of cost and performance. However, understanding their potential weaknesses is key to making informed choices and ensuring long-term value. Let's explore the five most common issues in more detail. 1.

Why is my solar inverter NOT working?

The inverter is detecting a condition - either internally, from the solar array, or from the electricity grid - that falls outside safe operating parameters, causing it to display an error code and/or disconnect from the grid (trip). Grid Disturbances (Voltage Rise): A very common issue in Australia, especially in areas with lots of rooftop solar.
