What is a web application?

A web application, or web app, is a software program that runs in a web browser. Unlike traditional desktop apps, web apps don't need to be downloaded or installed - users access them directly via the internet using any device. Behind the scenes, web apps rely on several key components to function properly.

What is the difference between a website and a web application?

Websites are mainly for sharing information. They are mostly static, meaning the content doesn't change often, and users only view the information. Examples include blogs, news sites, and restaurant menus. On the other hand, Web Applications are interactive and allow users to perform tasks.

How do web apps work?

Web apps can be accessed from all web browsers and across various personal and business devices. Teams in different locations can access shared documents, content management systems, and other business services through subscription-based web applications.

What are the components of a web application?

Web applications run on a client-server model, meaning users access them through a web browser without needing to download or install anything. They rely on three key components: Web Server - Handles user requests and directs them to the right place. Application Server - Processes tasks and generates responses.
