What is a 5G base station?

As the world continues its transition into the era of 5G, the demand for faster and more reliable wireless communication is skyrocketing. Central to this transformation are 5G base stations, the backbone of the next-generation network. These base stations are pivotal in delivering the high-speed, low-latency connectivity that 5G promises.

How does 5G work?

5G networks divide coverage areas into smaller zones called cells, enabling devices to connect to local base stations via radio. Each station connects to the broader telephone network and the Internet through high-speed optical fiber or wireless backhaul.

What are the advantages of a 5G base station?

**Massive MIMO:** The use of a large number of antennas allows the base station to serve multiple users simultaneously by forming multiple beams and spatially multiplexing signals. **Modulation Techniques:** 5G base stations support advanced modulation schemes, such as 256-QAM (Quadrature Amplitude Modulation), to achieve higher data rates.

What are base stations in 4G LTE networks called?

The base stations in 4G LTE networks are called either evolved Node B or eNodeB. You'll find that eNodeB is usually abbreviated as eNB in 5G network architecture diagrams, and gNodeB as gNB. It helps to keep mind that a base station called eNB is for 4G, and gNB is for 5G.
