Cooling systems are designed to provide adequate cooling for full load operation at a specified ambient air temperature typically between 40C° (104F°) and 50C° (122F°).

As a starting point, if the ductwork at both inlet and outlet is only some 1.5m long [at each end], then the cross sectional area of the inside of the ductwork should be twice the area that is designed at the ...

This paper aims at differentiating between the ambient temperature vs. air-on-core (AOC) method of rating the performance of a cooling system used on a generator set.

Reaching the maximum temperature of 374 o C is not a cost-effective option as reaching this temperature in saturated conditions also means reaching the water critical pressure (22.1 MPa), and ...

Factors such as climate and direction of prevailing winds must be considered in an outdoor installation. If your generator is expected to be in temperatures lower than -20 o F (-29 o C) consult the generator ...

A large amount of heat emitted during operation is discharged out of the machine room through the air outlet, so that the temperature in the machine room is as close to the ambient ...

Let's face it - generators aren't exactly the life of the party in power plants. But when it comes to generator inlet air temperature, these machines turn into divas faster than a pop star in a heatwave. ...

If an existing generator installation starts to have problems related to very high ambients, after all the usual factors have been eliminated, a review of the installation itself should be made including:
