Bees are busy producing honey and pollinating the native and non-invasive plant species beneath photovoltaic panels while they use the sun's energy to generate electricity. Beekeeping at ...

And depending on their flight path, the bee droppings could certainly effect production as it doesn't take a lot of coverage on a panel to severely drop efficiency. Yet, this may not be your ...

Unfortunately, bee populations have been declining in recent years due to various factors such as pesticide use, loss of habitat, and climate change. As such, it is important to understand the ...

The company Connexus Energy transformed more than 8 hectares of solar land into meadows full of wildflowers. The result was immediate and surprising. The vegetation reduced weeds and stabilized ...

Fortunately, this untrue belief has been disproved through research and actual examples showing that the coexistence of beekeeping with a PV park is possible. Solar parks can support insect pollinators ...

There is some limited evidence solar farms with mixed plant life can support a wider array of bee and butterfly communities than those with grass or gravel beds can, but researchers are still ...

Solar farms are beginning to become a thing in the U.S. and while that expansion is happening, there are more innovative ideas that are coming along as well, and that is, when natural ...

Aquatic insects can go over solar panels over and over again until they die, mesmerized by the dazzling three dimensional affect that it can have on their minds.
