Wind curtailment is the intentional reduction of wind power output to maintain grid stability. Learn about its causes, impacts, and strategies to minimise curtailment.

Weather radar, wind and waves forecast for kites, surfers, paragliders, pilots, sailors and anyone else. Worldwide animated weather map, with easy to use layers and precise spot forecast.

In current European markets entry decisions are driven at best by average curtailment. The marginal contribution of the last MW will be more heavily curtailed than the average, and so will deliver fewer ...

Across markets worldwide, average curtailment rates for wind and solar are generally quite low, often around 3%. However, these low average curtailment rates may overstate how much ...

Figures 3 and 4 illustrate wind and solar curtailment, respectively, in selected countries or areas in the form of C-E maps (correlation maps between energy share of wind/solar/wind+solar and annual ...

In the largest markets for wind power, the amount of curtailment appears to be declining even as the amount of wind power on the system increases. Curtailment levels have generally been 4% or less of ...

Curtailments occur when wind and solar are capable of generating electricity, but operators cannot dispatch that electricity into the grid. This data-file tabulates curtailment rates in ...

Windy provides real-time wind maps and accurate weather forecasts with user-friendly layers and precise spot forecasts.
